

# Improve performance. Save time. Save money.

Pressure Pro makes drinker line pressure management so quick and easy that producers can more effectively manage litter conditions to improve bird performance, while also cutting costly management time from every production cycle.

With Pressure Pro, producers can adjust the pressure of every drinker line at the same time in just seconds. It is so easy that producers can make adjustments as often as desired to optimize litter conditions and bird performance. No more walking the whole house to manage line pressures. This management tool assists producers in more effectively optimizing line pressures so birds receive the water they need while maintaining dry litter throughout the production cycle.

Installing Pressure Pro does not require any other changes to the watering system, and producers can retrofit Pressure Pro to all existing Ziggity floor watering systems.

### How it works.

All drinker line regulators are mounted to **A** Pressure Pro assemblies. The winch system cables **B** connect every Pressure Pro assembly in the house to a **C** central winch. Operating the winch manually, or by use of a controller, elevates or lowers every Pressure Pro and Ziggity regulator in the house. This change in regulator elevation increases or decreases the pressure in every drinker line. The same water pressure change is achieved in every line in just seconds.
